

CLAIMS

1. A liquid container provided with a hollow container body capable of accommodating any desired liquid and a neck extending upward from the top end of the container body, with a mouth for pouring liquid disposed at the top end of the neck, the liquid container comprising:
a movable part which can incline sideways said neck positioned above it in a prescribed position in the vertical position of the neck.
2. The liquid container according to Claim 1, wherein
said movable part is formed in a flange shape extending in the radial direction from the lower end side of the neck positioned above it and the flange-shaped part is formed to permit deformation in the vertical direction.
3. The liquid container according to Claim 2, wherein
said movable part is so formed as to permit holding the flange-shaped part in an upward deformed state and in a downward deformed state.
4. The liquid container according to Claim 2 or 3, wherein
said movable part is provided with a plurality of concaves positioned on the periphery of the flange-shaped part, disposed at intervals in the circumferential direction of the movable part.
5. The liquid container according to any of Claims 1, 2, 3 or 4, wherein
said container body, neck and movable part are formed integrally.
